

Lab 13: Qt Programming

Nathan Jarus

April 25, 2016

Introduction

In today's lab you will make a tiny phone book application. I've given you some starter code, but you still have a ways to go.

What you need to do

1. `newNumber` needs a signal it can use to send new phone number information.
2. Implement `newNumber::addPress()`.
3. `PhoneBook` needs to connect `newNumber`'s signal to a new slot.
4. `PhoneBook` needs a File menu with Open, Save, and Quit entries.
5. Finish implementing `deserialize()`.
6. Open and Save need to have their corresponding slots completed (see TODOs).
7. Make Quit prompt you before quitting if you haven't saved changes.

Epilogue

Make sure to commit your changes to the source files as well as the .pro file for compiling your code.
